

Culterra Holland gets CE certification for fertilisers - press release

Culterra sets standard for safety and quality by achieving CE certificate

Culterra is proud to announce that its leading organic and organo-mineral fertilisers can now be labelled with official CE marking at the request of customers. Culterra was assessed for conformity by EFCI Register, marking an important milestone for Culterra and underlining the leading organic fertiliser producer's commitment to quality, safety and sustainability. Moreover, CE marking shows Culterra's customers that they are working with a product that complies with the European Fertiliser Products Regulation.

CE certification demonstrates that Culterra and its products comply with strict safety, health and environmental protection requirements, as well as confirming that Culterra meets all relevant standards and that its organic and organo-mineral fertilisers are produced in a consistent manner. This offers customers the assurance of a reliable and high-quality product.

Access to the European market

Culterra can now supply all its CE-marked products to customers in EU member states without restrictions, expediting deliveries and improving product availability.

Optimal risk management and sustainability

Customers can rest assured that all Culterra products are thoroughly tested and comply with key safety standards and environmental impact requirements. By obtaining CE marking, Culterra has aligned itself with the growing demand for sustainable and safe organic fertilisers.

Strengthening confidence in Culterra

"Achieving CE certification confirms our commitment to excellence across the board," says Leon Fock, managing director and owner of Culterra Holland. "Customers can now rest assured that we provide safe, sustainable and high-quality products that meet all their expectations."

EU Fertiliser Products Regulation

Since the summer of 2022, fertiliser producers, traders and farmers have had to comply with the EU Fertiliser Products Regulation, which has significantly changed CE marking rules and labelling requirements for fertilisers. With the new regulation, it is now possible to market a very wide range of fertilisers within the EU, including organic fertilisers, organo-mineral fertilisers, growing media or biostimulants, provided they meet all applicable environmental and safety requirements.
